At regular intervals, RISI runs tests and reports on the world's fastest paper machine. However, what the results do not indicate is that 84% of these installations rely on NASH liquid ring vacuum pumps for dewatering and the vacuum system.

In January 2008, the latest RISI report concerning "The World's fastest Paper and Board Machines" was published. A total of 25 paper machines, in different categories worldwide, were identified as the fastest installations in their class.

For Gardner Denver Nash, manufacturer of vacuum and dewatering systems for paper machines, this report has an additional and entirely different meaning. According to company records, NASH liquid ring vacuum pumps are fitted to 84% of these paper machines. For the company, this is more outstanding proof that the market primarily targets proven and, more importantly, reliable technology.

The great flexibility of a vacuum system based on NASH liquid ring vacuum pumps guarantees sufficient capacity even if maintenance work is carried out on individual machines. Continuous operation of the dewatering system - and the complete paper machine - is guaranteed as a result. Another important reason for using NASH liquid ring pumps is that they are not vulnerable to liquid carry-over and fibers in the air stream. Consequently, even minor faults in the process cycle do not influence the drainage system's function.
